Abstract of DE19720470

The telecommunication device includes a casing (2) with at least one call activation device (4, 5, 6) solely associated with a single subscriber number. A selection device is provided for a construction of a wireless telecommunication connection in response to an activation of the call activation device. A memory arrangement (9) is provided for a storage of data, whereby the memory arrangement transfers the data automatically to the subscriber, after the construction of the communication connection. The call activation device is formed as a call key or any manually activated element, operated through pushing or pulling, especially a cut line. The position of caller is determined via a GPS (18).
